4.0 TEAMWORK ISSUES 4

5.0 DRAFTS 5

1.0 Completed Tasks

Since the last standup the team focused on advancing the technical components including the data, visualisations and the front-end interface of the project. The work was split across these categories accordingly.

Syed successfully cleaned and standardised the datasets required for the project visualisations. The datasets were sourced from the Organisation for Economic Co-operation and Development (OECD) and spans ten-years across 2015-2024. The first iteration of the visualisations was discussed during standup 2 and implemented thereafter.

Dilhani conducted a comprehensive code review and refactor of the front-end of the website supporting Assignment 3C: Website and Visualisation. The focus was to bridge the technical outputs (D3 visualisations) with user-centered presentation. The User Interface was improved to enhance readability and support the visual storytelling by guiding end users through the projects narrative.

2.0 Estimate of Contribution

At the commencement of the project, the team discussed and assessed individual skill strengths. Syed's background with technical work led to his assignment of data preparation and visual constructions. Dilhani's background in technical documentation, front-end design and interface layout saw UI design and document writing assigned to her. Tasks were assigned to maintain an equitable workload balance while leveraging specialised capabilities, maximising the project efficiency.

	Syed		Dilhani	
Finding and working with the dataset	2.0 hrs	100%	0.0 hrs	0%
Designing the visualisation	1.0 hr	65%	1.0 hr	65%
Writing/researching code	3.0 hrs	75%	3.0 hrs	75%
Writing Standup 1 report	0.0 hrs	0%	2.0 hrs	100%
Writing up Assignment 3B: Project process book	1.5 hrs	50%	1.5 hrs	50%

Note on Task Percentages: Percentages reflect the cumulative progress of the total task toward 100% completion for the overall project. Where both team members list an identical percentage (e.g. 65%), it indicates a collaborative task where both members contributed equally.

Designing the visualisations was a collaborative effort, with discussions held during standup 2. Syed focused on the D3 code to build the visualisations and Dilhani focused on the reporting deliverables and HTML + CSS for web presentation. Both team members achieved an equal workload distribution of 7.5 hours logged each for this reporting cycle.

3.0 Team Task To-Do List

List of tasks to be completed before next standup:

1. Complete and submit Assignment 3A: Project Standup 2.
2. Review the visualisations for ease of readability by conducting a heuristic evaluation.
3. Implement website content to directly contextualise and answer the five core guiding questions explored with the visualisations.
 - Do countries with higher health expenditure have a longer life expectancy?
 - What are OECD countries' differences in spent per person on health care?
 - In years, how long does the average person live in the selected OECD countries?
 - What is the pattern of change in healthcare cost & life expectancy over time?
 - Which countries have a relatively high life expectancy for their healthcare spending?

The base static visualisations have been completed which satisfactorily address the guiding questions. The next reporting period will be focused on improving and layering the visualisations to incorporate interactivity for dynamic storytelling.

4.0 Teamwork Issues

No teamwork issues were noted during this reporting period. The team successfully mitigated communication frictions encountered during the earlier project stages by implementing the operational practices of regular communication, scheduled standups and clear task allocation which helped maintain independent accountability and effective collaboration.

5.0 Drafts

Current version of Assignment 3B: Project Process Book

Assignment 3B: Project Process Book COS30045 – Data Visualisation Team 1E 2. Data 2.1 Data Sources Currently, two datasets on OECD health statistics are used in the project: - Life Expectancy dataset - Healthcare Expenditure dataset This set of data is used to create a plot of life expectancy versus country for years. The country name and year value are relevant attributes, so is life expectancy value. The dataset on health expenditure provides information on health expenditure at country level and over time. Relevant attributes are country and year and value of healthcare expenditure. Both datasets are in CSV and stored in the project's GitHub repository and loaded on the website with D3.js. Data source: - OECD Health Statistics – Life Expectancy - OECD Health Statistics – Health Expenditure and Financing Source link: - OECD Data Explorer – Life expectancy - OECD Data Explorer – Health expenditure and financing The datasets are mostly tabular data including categorical and quantitative data. The attributes are categorical for country, then numerical for life expectancy, year and healthcare expenditure that are used for visualisations. Only attributes that are needed for visualisation will be utilised. If the need to compare the countries, years, healthcare expenditure and life expectancy does not require one or more additional metadata fields, they will not appear in the final visualisation. 2.2 Data Processing After examination of the datasets, it is evident that there are a lot of attributes and observations in the OECD CSV files that are not needed for the project. The data sets will therefore be limited to the focus aspect, i.e. to the countries, years and measures that are relevant to the visualisation.	Assignment 3B: Project Process Book COS30045 – Data Visualisation Team 1E Each observation will include Country and Year will be used for matching the two datasets: - Country - Year - Life expectancy - Healthcare expenditure Early testing has been done with the D3.js library to load in each dataset and create a merged dataset with matched observations. Additional data cleaning and processing will take place as the visualisation is developed. Any further filtering, transformation or derived variables will be documented in this section.	Assignment 3B: Project Process Book COS30045 – Data Visualisation Team 1E 3. Requirements 3.1 Must-have Features Based on the project needs, there is a list of must have requirements that should be considered at the very beginning of the design of the project: - Import health statistics from OECD into D3.js. - Visually represent expenditure on health and life expectancy. - Enable a comparison between O.E.C.D. countries selected. - Give user the ability to see how things changed over the years. - Clearly label axis, values and countries. - Give suitable titles and descriptions for visualisations. - Provide visualisations on the internet. - Ensure the visualisations are understandable and easy to use. 3.2 Optional Features Some other options may be included: Clicking on any value displays detailed values in tooltips. - Countries selection/filter. - A method is provided for choosing or filtering on a year level. - Highlighting individual countries. - Animated screen change or animation when filters change. - Additional charts of trends over time. - A layout-to-fit screens for varying screen sizes. The above will be factored in with regard to time and usefulness to the project when developing.
